

Patent claims

1. Method for administration of presence information in a telecommunication network and/or data network, especially for implementing a service based on the presence information,
5 in which,
administration data is entered for an administration process by voice input and recognition or by keypad entry of a PIN code or within a predefined short message framework or at an IPbased interface, outside a SIP method, and subsequently converted in an
10 SIP-conformant format to execute the administration process.
2. Method according to Claim 1,
in which,
the administration process involves updating of presence information.
- 15 3. Method according to Claim 1,
in which,
the administration process involves a definition of a group of a subscribers who can access the presence information.
4. Method according to Claim 1,
20 in which,
the administration process involves subscription to presence information of another subscriber or to service based on the presence information.
5. Method for administration of presence information in a
25 telecommunication network and/or data network, especially for implementing a service based on the presence information,

in which,

administration data is fed in from an external information system for a change of the presence status without active input by the subscriber whose presence status is administered and is subsequently
5 converted into an SIP-conformant format for executing the change to the presence status.

6. Method for administration of presence information in a telecommunication network and/or data network, especially for implementing a service based on the presence information,

10 in which,

output data arising within the framework of an administration process is output by speech synthesis and output or by text output in a predefined short message frame or of an instant message or by optical or acoustic signaling or via a pop-up window at a data
15 terminal, in which case a conversion is undertaken, before output from an SIP-conformant primary format, into a secondary format suitable for an output mode.

7. Method according to Claim 6,

in which,

20 the administration process involves information about a change of the presence status of a prespecified subscriber.
